

ABSTRACT

A card device (1) includes a card case (4), a circuit board (5) disposed in the card case (4), and an antenna (7) rotatably disposed on the outside of the card case (4). An antenna rotating shaft (12) is disposed on the base end of the antenna (7) and inserted from the outside into the inside of the card case (4) through a through-hole (13) of the card case (4) such that the antenna rotating shaft extends along the surface of the circuit board (5) and is supported within the card case (4) such that the inner part of the antenna rotating shaft is apart from the circuit board (5) and the antenna rotating shaft is freely rotatable. A feed terminal (20) having elasticity that causes the feed terminal (20) to be urged against the antenna rotating shaft (12) is disposed between the antenna rotating shaft (12) and a part of the circuit board facing the antenna rotating shaft (12). The feed terminal (20) is fixed to an antenna connection part of a circuit formed on the circuit board (5) facing the antenna rotating shaft (12). The feed terminal (20) is urged into contact with the antenna rotating shaft (12).
